

Verseon presents second anticoagulation candidate for clinical trials at AHA 2017

“The pharmacological profile of our anticoagulants puts us in the unique position to address the unmet need for long-term combination therapy with anti-platelets,” commented Verseon’s CEO Adityo Prakash. “This has the potential to have a major impact on the anticoagulation market.”

“We are excited to have two drug candidates heading to the clinic in 2018,” said Dr. Datta. “Both development candidates

About Verseon’s anticoagulation program

Verseon’s potent, highly selective oral direct thrombin inhibitors have shown excellent efficacy in multiple preclinical studies, but do not disrupt platelet function. This unique feature could explain the low bleeding risk of these precision anticoagulants and makes them excellent candidates for use in long-term combination anticoagulant-antiplatelet therapy. Two development candidates are expected to enter clinical trials in 2018, one of which has also demonstrated very low renal clearance, a highly desirable property for patients with impaired kidney function.
